NATIONAL UNIVERSITY OF COMPUTER AND EMERGING SCIENCES
CL 103 - COMPUTER PROGRAMMING LAB

Instructors: Mr. Basit Ali, Ms. Mahrukh Khan, Ms. Ammara Yaseen, Ms. Tooba Ali, Ms. Maham Mobin, Mr. Muhammad Irfan Ayub

Email: basit.jasani@nu.edu.pk , mahrukh.khan@nu.edu.pk, ammara.yaseen@nu.edu.pk, tooba.ali@nu.edu.pk, maham.mobin@nu.edu.pk, muhammad.irfan@nu.edu.pk

Lab # 03

Outline

- Classes
- Objects
- Structures VS Classes
- Transformation from Procedural to Object Oriented Programming
- Example Programs
- Exercise

CLASSES

A class is a programmer-defined data type that describes what an object of the class will look like when it is created. It consists of a set of variables and a set of functions.

Classes are created using the keyword **class**. A class declaration defines a new type that links code and data. This new type is then used to declare objects of that class.

In the UML, a class icon can be subdivided into compartments. The top compartment is for the name of the class, the second is for the variables of the class, and the third is for the methods of the class.

CLASS NAME
Data Members Or Variables
Member Functions

```
class class-name
{
access-specifier:
data

access-specifier:
functions

};
```

CLASS NAME
By convention, the name of a user-defined class begins with a capital letter and, for readability, each subsequent word in the class name begins with a capital letter.

DATA MEMBERS
Consider the attributes of some real world objects:

RADIO – station setting, volume setting.
CAR – speedometer readings, amount of gas in its tank and what gear it is in.

These attributes form the data in our program. The values that these attributes take (the blue color of the petals, for example) form the state of the object.

MEMBER FUNCTIONS
Consider the operations of some real world objects:

RADIO – setting its station and volume (invoked by the person adjusting the radio's controls)
CAR – accelerating (invoked by the driver), decelerating, turning and shifting gears.

These operations form the functions in program. Member functions define the class's behaviors.

OBJECTS

In C++, when we define a variable of a class, we call it **instantiating** the class. The variable itself is called an **instance** of the class. A variable of a class type is also called an **object**. Instantiating a variable allocates memory for the object.

RADIO r;
CAR c

STRUCTURES VS. CLASSES

By default, all structure fields are public, or available to functions (like the main() function) that are outside the structure. Conversely, all class fields are private. That means they are not available for use outside the class. When you create a class, you can declare some fields to be private and some to be public. For example, in the real world, you might want your name to be public knowledge but your Social Security number, salary, or age to be private.

TRANSFORMATION FROM PROCEDURAL TO OBJECT ORIENTED PROGRAMMING

```cpp
#include<iostream>
using namespace std;

double calculateBMI(double w, double h)
{
  return w/(h*h)*703;
}

string findStatus(double bmi)
{
 string status;
if(bmi < 18.5)
   status = "underweight";
else if(bmi < 25.0)
   status = "normal";// so on.
return status;
}

int main()
{
    double bmi, weight, height;
    string status;
    cout<<"Enter weight in Pounds ";
    cin>>weight;
    cout<<"Enther height in Inches ";
    cin>>height;
    bmi=calculateBMI(weight,height);
    cout<<"Your BMI is "<<bmi<<" Your status is "<<findStatus(bmi);

}
```

PROCEDURE ORIENTED APPROACH

```cpp
#include<iostream>
using namespace std;
class BMI
{
    double weight, height,bmi;
    string status;
    public:
        void getInput() {
            cout<<"Enter weight in Pounds ";
            cin>>weight;
            cout<<"Enther height in Inches ";
            cin>>height;    }
        double calculateBMI() {
            return weight / (height*height)*703; }
        string findStatus() {
            if(bmi < 18.5)
                status = "underweight";
            else if(bmi < 25.0)
                status = "normal";// so on.
            return status; }
        void printStatus()  {
            bmi = calculateBMI();
            cout<< "You BMI is "<< bmi<< "your status is " << findStatus(); }
};

int main()
{
    BMI bmi;
    bmi.getInput();
    bmi.printStatus();
}
```

OBJECT ORIENTED APPROACH

EXAMPLE PROGRAM

#include<iostream>

using namespace std;

class Account
{
private:
        double balance; // Account balance

public: //Public interface:
        string name; // Account holder
         long accountNumber; // Account number

Account
+ name : string + accountNumber : long - Balance : double
+ setDetails() : void + getDetails() : double + displayDetails() : void

```cpp
void setDetails(double bal)
{
        balance = bal;
}
double getDetails()
{
        return balance;
}
void displayDetails()
{
        cout<<"Details are: "<<endl;
        cout<<"Account Holder: "<<name<<endl;
        cout<<"Account Number: "<< accountNumber <<endl;
        cout<<"Account Balance: "<<getDetails()<<endl;
}

};

int main()
{
        double accBal;
        Account currentAccount;

        currentAccount.getDetails();

        cout<<"Please enter the details"<<endl;
        cout<<"Enter Name:"<<endl;
        getline(cin, currentAccount.name);
        cout<<"Enter Account Number:"<<endl;
        cin>>currentAccount.accountNumber;

        cout<<"Enter Account Balance:"<<endl;
        cin>>accBal;
        currentAccount.setDetails(accBal);
        cout<<endl;

        currentAccount.displayDetails();
        return 0;
}
```

Set and get functions to manipulate private data member

Publically available data: Assigning values in main

Private data: Can only assign values from main

```
Please enter the details
Enter Name:
Dummy
Enter Account Number:
9256432
Enter Account Balance:
25000

Details are:
Account Holder: Dummy
Account Number: 9256432
Account Balance: 25000
```

OUTPUT OF EXAMPLE PROGRAM

LAB 03 EXERCISES

QUESTION#1
Create a class Rectangle with attributes length and width, each of which defaults to 1. Provide member functions that calculate the perimeter and the area of the rectangle. Also, provide set and get functions for the length and width attributes. The set functions should verify that length and width are each floating-point numbers larger than 0.0 and less than 20.0.

QUESTION#2
Create a class called Employee that includes three pieces of information as data members—a first name (type char*), a last name (type string) and a monthly salary (type int). Your class should have a setter function that initializes the three data members. Provide a getter function for each data member. If the monthly salary is not positive, set it to 0.Write a test program that demonstrates class Employee's capabilities. Create two Employee objects and display each object's yearly salary. Then give each Employee a 10 percent raise and display each Employee's yearly salary again. Identify and add any other related functions to achieve the said goal.

QUESTION#3
Create a class called Invoice that a hardware store might use to represent an invoice for an item sold at the store. An Invoice should include four data members—a part number (type string), a part description (type string), a quantity of the item being purchased (type int) and a price per item (type float). Your class should have a functions that initializes the four data members. Provide a get function for each data member. In addition, provide a member function named getInvoiceAmount that calculates the invoice amount (i.e., multiplies the quantity by the price per item), then returns the amount as a float value. If the quantity is not positive, it should be set to 0. If the price per item is not positive, it should be set to 0. Write a test program that demonstrates class Invoice's capabilities.

QUESTION#4
Write C++ code to represent a hitting game. The details are as follows:
This game is being played between two teams (i.e. your team and the enemy team).
The total number of players in your team is randomly generated and stored accordingly.
The function generates a pair of numbers and matches each pair. If the numbers get matched, the following message is displayed:
<div align="center">"Enemy got hit by your team!"</div>
Otherwise, the following message is displayed:
<div align="center">"You got hit by the enemy team!"</div>
The number of hits should be equal to the number of players in your team.
The program should tell the final result of your team by counting the hits of both the teams.
Consider the following sample output:

```
Total No. Of Players in your team: 3

Pair of numbers:
Number1: 3
Number2: 3
Enemy got hit by your team!

Pair of numbers:
Number1: 1
Number2: 1
Enemy got hit by your team!

Pair of numbers:
Number1: 5
Number2: 1
You got hit by the enemy team!
Game Over! You won
```

QUESTION#5

MyJava Coffee Outlet runs a catalog business. It sells only one type of coffee beans. The company sells the coffee in 2-lb bags only and the price of a single 2-lb bag is $5.50 when a customer places an order, the company ships the order in boxes. The boxes come in 3 sizes with 3 different costs:

	Large Box	Medium Box	Small Box
Capacity	20 Bags	10 Bags	5 Bags
Cost	$1.80	$1.00	$0.60

The order is shipped using the least number of boxes. For example, the order of 52 bags will be shipped in 2 boxes: 2 large boxes, 1medium and 1 small. Develop an application that computes the total cost of an order.

> Number of Bags Ordered: 52
> The Cost of Order: $ 286.00
> Boxes Used:
> 2 Large - $3.60
> 1 Medium - $1.00
> 1 Small - $0.60
> Your total cost is: $ 291.20

QUESTION#6

Write a class named Vehicle that can represent both the Rickshaw and Bike on the basis of number of wheels it has. Each vehicle has the following details

- **year**. An int that holds the vehicle's model year.
- **manufacturer**. A string that holds the manufacturer name of that vehicle.
- **speed**. An int that holds the vehicle's current speed.

In addition, the class should have the following member functions.

- **accelerate**. The accelerate function should add 5 to the speed member variable each time it is called.
- **brake**. The brake function should subtract 5 from the speed member variable each time it is called.

Demonstrate the class in a program that creates a Vehicle object for a Rickshaw and for a Bike both, and then calls the accelerate function five times. After each call to the accelerate function, get the current speed of the car and display it. Then, call the brake function two times. After each call to the brake function, get the current speed of the car and display it.
